Sequences AAW81478 to AAW81491 represent syntehtic peptide analogs of thrombospondin (thrombin sensitive protein or 1859) that retain thrombospondin (thrombin sensitive protein or 1859) that retain mimicking a biological activity. The invention provides a method for (a) mimicking a biological activity of thrombospondin; (b) promoting thromboils activity of thrombospondin (b) promoting thrombospondin other than thromboils activity. The method comprises administering any of these peptides. Biological activities of thrombospondin include cell adhesion-promoting activity, cell mitogenic activity, cell chemotactic activities, haemostatic activities, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW97439-41 represent sequences that are not contained within a peptide that stimulates neuronal (particularly axonal) sprouting in neurons of the cerebral cortex, and in spinal cord cells inhibits aggregation and defasiculation of neurites while increasing formation of synaptic contacts. The peptide is used to regenerate nervous system cells, particularly for treating neurodegeneration (e.g. Alzheimer's or Parkinson's diseases, multiple sclerosis and
                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                 The peptide may have an NH2 gp on Gly(9) (peptide p6) and Trp(1) may be formylated (peptide p5). The peptide is a synthetic fragment of human thrombospondin and comprises the sequence motif of Robson et al (Nature (1988) 333:79-82). It has thrombospondin-11ke activity and can be used:
(1) to inhibit throwur cell metastasis and atherosclerosis:
(2) to promote or nhibit platelet aggregation, anglogenic activity, thrombotic or thrombolytic activity, immune modulaton and cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptides for promoting growth of neurons - useful for treatment of neurodegeneration, neuroblastoma and as additives for neuronal cell cultures
                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                    (3) to promote wound healing; and (4) as an antiviral agent (interferes with cell adhesion). The peptide is prepa by std. synthesis techniques. See also AAR1367-R13641.
                                                                                                                                                                                                                                                                                                                                               Length 9;
                                                                                                                                                                                                                                                                                                                                                                               0; Indels

thrombospondin include cell adhesion-promoting activity, cell mitogenic activity, cell chenciactic activities, haemostatic activities, and activities that derive from these activities, e.g. tumour-cell, microbial or parasite metastasis activity, platelet aggregating activity, fibriolythic activity and immune modulation. The peptides are capable of inhibiting tumour metastasis. The peptides are useful in wound healing, atherosclerosis, malaria, thrombotic and thrombolytic conditions and anglogenesis, and as cell attachment promoters, complement modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAW81478 to AAW81491 represent syntehtic peptide analogs of thrombospondin (thrombin sensitive protein or TFSP) that retain thrombospondin (thrombin sensitive protein or TFSP) that retain thrombospondin-like activity. The invention provides a method for (a) mimicking a biological activity of thrombospondin; (b) promoting thrombospondin controlly; or (c) inhibiting a biological activity of thrombospondin other than thrombost activity. The method comprises administering any of these peptides. Biological activities of thrombospondin include cell adhesion-promoting activity, cell mitogenic activity, cell chemotactic activities, haemostatic activities, and

                                                                                                                                                                                                                                                                                  ö
  activities that derive from these activities, e.g. tumour-cell, microbial or parasite meteastasis activity, platelet aggregating activity inbrinds are metages activity and immune modulation. The peptides are capable of inhibiting tumour metastasis. The peptides are useful in wound healing, atherosclerosis, malaria, thrombotic and thrombolytic conditions and anglogenesis, and as cell attachment promoters, complement modulators and diagnostic reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences AAW81478 to AAW81491 represent syntehtic peptide analogs of thrombospoodin (thrombin sensitive protein or TSP) that retain thrombospoodin (thrombin sensitive protein or TSP) that retain thrombospoodin' like activity. The invention provides a method for (a) mimicking a biological activity of thrombospoodin: (b) promoting thrombospoodin cactivity or (c) inhibiting a biological activity of thrombospoodin other than thrombosic activity. The method comprises administering any of these peptides. Biological activities of
                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thrombospondin; thrombin sensitive protein; TSP; cell-adhesion; mitogenic activity; chemotactic; haemostatic; tumour; microbial; parasite; metastasis; platelet aggregation; fibrinolytic; malaria; immune modulation; wound healing; atherosclerosis; anglogenesis; complement modulator; diagnostic reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Method for mimicking or inhibiting thrombospondin activity - using thrombospondin peptides
                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the antigenic epitope P547, derived from sporozoite surface protein-2 (SSP-2) of the sporozoite stage of a Plasmodium falciparum. It is used in the construction of recombinat protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melitin signal peptide, (His) 6 tay, T-cell peitope from tetanus toxoid and 21 antiganic epitopes from circumasporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), mSP-2, apical membrane antigen-1 (AMA-1), crythrocyte binding antigen-175 (EBA-157), rhoptry associated protein-1 (RAM-1) and gamete specific antigen, P5G27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has
activities that derive from these activities, e.g. tumour-cell, microbial or parasite metastasis activity, platelet aggregating activity, fibrinolytic activity and immune modulation. The peptides are capable of inhibiting tumour metastasis. The peptides are useful in wound healing, atheroscierosis, malaria, thrombotic and thrombolytic conditions and anglogenesis, and as cell attachment promoters, complement modulators and diagnostic reagents.

NAME OF COLOR OF STREET OF

```
The sequences given in AAR51427-35 are peptide fragments derived from region II+ of the circumsporozoite (CS) protein derived from various Plasmodium species. These peptides fragments may be used as an inhibitor for the binding of CS polypeptides to receptors of hepatocytes from malaria-susceptible mammals. These peptides can be administered to malaria susceptible mammals to prevent infection, and they can be used to produce antibodies which can be used to produce antibodies which can be used to prevent infection. The peptides were tested for inhibition of CS binding to liver sections or to the human hepatocyte cell line HepG2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Region II+; circumsporozoite; CS; Plasmodium; inhibitor; binding;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide(s) corresp. to Region II+ of circumsporozoite - are used for inhibiting hepatocyte invasion by malarial sporozoites for preventing malaria infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR51427-35 are peptide fragments derived from region II+ of the circumsporozoite (CS) protein derived from various Plasmodium species. These peptides fragments may be used as an inhibitor for the binding of CS polypeptides to receptors of hepatocytes from malaria-susceptible mammals. These peptides can be administered to malaria susceptible mammals to prevent infection, and they can be used to produce antibodies which can be used to prevent infection. The peptides were tested for inhibition of CS binding to liver sections or to the human hepatocyte cell line HepG2.

The sequences given in AAR51427-35 are peptide fragments derived from region II to of the circumsporozoite (CS) profetin derived from various plasmodium species. These peptides fragments may be used as an inhibitor for the binding of CS polypeptides to receptors of hepatocytes from malaria-susceptible mammals. These peptides can be administered to malaria susceptible mammals to prevent infection, and they can be used to produce antibodies which can be used to prevent infection. The peptides were tested for inhibition of CS binding to liver sections or to the human hepatocyte cell line HepG2.
                                                                                                                                                                                                                                                                                                                                                                                                                Region II+; circumsporozoite; CS; Plasmodium; inhibitor; binding; receptor; hepatocytes; malaria-susceptible; mammal; infection; antibody; liver; human hepatocyte cell line; HepG2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide(s) corresp. to Region II+ of circumsporozoite - are used for inhibiting hepatocyte invasion by malarial sporozoites for preventing malaria infection

                                                                                                                                                                                                                                                                                                                                                                               ö
                                        The sequences given in AAR51427-35 are peptide fragments derived from Pregion II + of the actrounsporzozie (CS) protein derived from various Plasmodium species. These peptides fragments may be used as an inhibitor for the binding of CS polypeptides to receptors of hepatocytes from malaria-susceptible mammals. These peptides can be administered to malaria susceptible mammals to prevent infection, and they can be used to produce antibodies which can be used to prevent infection. The peptides were tested for inhibition of CS binding to liver sections or to the human hepatocyte cell line Hepd2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAR51427-35 are peptide fragments derived from region IT+ of the circumsporozoite (CS) profesin derived from various plasmodium species. These peptides fragments may be used as an inhibitor for the binding of CS polypeptides to receptors of hepatocytes from malaria-susceptible mammals. These peptides can be administered to malaria susceptible mammals to prevent infection, and they can be used to produce antibodies which can be used to prevent infection. The peptides were tested for inhibition of CS binding to liver sections or to the human hepatocyte cell line HepG2.
                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                            The present invention relates to a first generation recombinant adenoviral vector, part of which integrates into a host cell genome. Twinverted terminal repeats (ITRs) allow integration of a transgene into the host genome. The invention can be used to make 'gutless' vectors for gene therapy, e.g. of sickle cell anemia or thalassemia (targeting hematopoietic cells) or atherosclerosis or restenosis (targeting endothelial cells), or more generally a wide range of genetic diseases, cancers and infectious diseases.
                                                                                                                                                                                                               Recombinant adenoviral vector containing transgene, used to produce gutless vectors for gene therapy, targetable to selected cells and lacking antigenicity \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Amino acid sequence of the malaria (M) string CTL epitope TRAP AM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating CD8-positive \mathtt{T} cell response to target antigen using recombinant poxvirus - for treating or preventing malaria and \mathtt{HIV}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               McMichael AJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW59270-W59274 are fragments of malarial circumsporozoite (CS) region II isolated from Plasmodium falciparum. These fragments can be used as ligands in a method for the targeted delivery of nucleic acid to cells in culture or cells in vivo, especially where the cells are hepatocytes. Therapy of diseases such as cancer, malaria, hepatitis, cystic fibrosis, hypercholesterolaemia, phenylketonuria and haemophilia is mentioned. CS polypeptides are liver cell specific with rapid hepatic invasion. They are more efficient than the prior art asialocrosomucoid (ASOR) ligands, of which there may be an accumulation in certain diseases due to
                                                                        Malaria; gene therapy; hepatocyte; liver; circumsporozoite; ligand; targeted delivery; therapy; disease; cancer; hepatitis; cystic fibrosis; hypercholesterolaemia; phenylketonuria; haemophilia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide RII derived from malaria circumsporozoite surface protein.

The invention relates to methods and reagents for generating a protective CD8+ T-cell immune response against at least one target antigen. The Kits of the invention comprises (i) as priming composition, a source of one or more CD8+ T-cell [Cytotoxic T lymphocytes-(CTL)] composition a source of the target antigen, plus a carrier and (ii) as boosting composition a source of CTL epitopes, with at least one CTL epitope the composition a source of CTL epitopes, with a least one CTL epitope the composition impaired recombinant powirus vector [WV) plus a carrier. If the source of CTL epitopes in (i) is a viral vector, then the vector in (ii) is from a different virus. The kits are used to generate an immune response (prophylactic or therapeutic) against pathogens or unnours, specifically against malaria parasites such as P. falciparum, or HIV, and specifically against malaria parasites such as P. falciparum, or HIV, and also used for protective response against melanoma and cancer of breast or colon, and generally wherever a strong CD8+ response is protective. The boosting composition may be used alone to boost a naturally primed cresponse against malaria. The specified pvv provide an excellent booster effect, better than that from wild-type poxvirus, resulting in complete rather than partial protection against approxozoite challenge. Also Pvv are sets to use than wild-type virus. Sequences AAV03661-680 represent CTL.
infection, also epitope strings from Plasmodium and HIV

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Circumsporozoite protein precursor - Plasmodium cynomolgi (strain Berok)
N.Alternate names: major sporozoite surface antigen
C.Species: Plasmodium cynomolgi
C.Species: 10.5ep-1987 #sequence_revision 30-Sep-1987 #text_change 07-Nov-1997
C.Accession: D26255
R.Salinski, M.R.; Arnot, D.E.; Cochrane, A.H.; Barnwell, J.W.; Nussenzweig, R.S.; Ene
R.Salinski, M.R.; Arnot, D.E.; Cochrane, A.H.; Barnwell, J.W.; Nussenzweig, R.S.; Ene
R.Stile: The circumsporozoite gene of the Plasmodium cynomolgi complex.
A;Reference number: A90889; MUID:87102878
A;Reference number: A90889; MUID:87102878
A;Recossion: D26255
A;Molecule type: DNA
A;Residues: 1-378 cGAL>
C;Comment: There are three distinct regions in the mature circumsporozoite protein, thoolic membrane-anchoring sequence.
C;Comment: There are 10 tandem copies of a 9-residue repeat
C;Superfamily: circumsporozoite protein; thrombospondin type 1 repeat homology
C;Keywords: sporozoite; surface antigen; tandem repeat
E;1-19/Domain: signal sequence #status predicted <SIG>
F;20-3784/Region: 9-residue repeats
F;303-356/Domain: thrombospondin type 1 repeat homology <THRI>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Circumsporozoite protein precursor - Plasmodium cynomolgi (strain Ceylon)
NiAternate names: major sporozoite surface antigen
Ci Species: Plasmodium cynomolgi
Ci Species: Plasmodium cynomolgi
Ci Species: Plasmodium cynomolgi
Ci Species: Plasmodium cynomolgi
Ci Species: Jo-Sep-1987 #sequence_revision 30-Sep-1987 #text_change 07-Nov-1997
Ci Accession: C26225
Ridalinski, M.R.; Arnot, D.E.; Cochrane, A.H.; Barnwell, J.W.; Nussenzweig, R.S.; Enea, A.Title: The circumsporozoite gene of the Plasmodium cynomolgi complex.
A:Title: The circumsporozoite gene of the Plasmodium cynomolgi complex.
A:Reterence number: A90889; MUDD:87102878
A:Anchecula: type: Dax
A:Residues: 1-398 cGAL>
C:Comment: There are three distinct regions in the mature circumsporozoite protein, the object membrane anchoring sequence.
C:Comment: There are 16 tandem copies of a 9-residue repeat and 3 copies of a 17-residue C:Superfamily: circumsporozoite protein; thrombospondin type 1 repeat homology
C:Reywords: sporozoite; surface antigen; tandem repeats
F:197comain: signal sequence #status predicted <SIGS
F:20-398/Product: circumsporozoite protein #status predicted <AMT>
F:20-398/Product: circumsporozoite protein #status predicted <AMT>
C:Comment: The copies of a presidue repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ticumsporozoite protein - Plasmodium reichenowi
Specias: Plasmodium reichenowi

circumsporozoite protein - Plasmodium malariae (strain Uganda 1-CDC)
C;Species: Plasmodium malariae
C;Date: 06-Oct-1994 #sequence_revision 04-Nov-1994 #text_change 20-Aug-1999
C;Accession: A54504
R;Lal, A.A.; de la Cruz, V.F.; Campbell, G.H.; Procell, P.M.; Collins, W.E.; McCutcha Mol. Blochem. Parasitol. 30, 291-294, 1988
A;Title: Structure of the circumsporozoite gene of Plasmodium malariae.
A;Reference number: A54504; MUID:89040027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Circumsporozoite protein - malaria parasite (Plasmodium falciparum) (strain Wellcome) (Species: Plasmodium falciparum (Cipaciparum Cipacies: Plasmodium falciparum Cipacies: 28-Oct-1994 #sequence_revision 28-Oct-1994 #text_change 09-Jun-2000 Cipacession: A54529 #sequence_revision 28-Oct-1994 #text_change 09-Jun-2000 Cipacession: A54529 #s.T.

OZZOAM

Circumsporozoite protein precursor - Plasmodium cynomolgi (strain Mulligan/NIH)

N.Alternate names: major sporozoite surface antigen

C.Species: Plasmodium cynomolgi

C.Species: Bozoita in 20.2625

R.Galinski, M.R.; Arnot, D.E.; Cochrane, A.H.; Barnwell, J.W.; Nussenzweig, R.S.; Enea, Cell 48, 311-319, 1987

A.Fitle: The circumsporozoite gene of the Plasmodium cynomolgi complex.

A.Accession: Bozois

C.Superfamily: Circumsporozoite protein; Actures

F.119/Pomaln: signal sequence #status predicted <AMT>
F.30-419/Pomaln: thrombospondin type I repeat homology <ATHRI>

F.344-397/Domain: thrombospondin type I repeat homology <ATHRI>

MOL. Biochem. Parasitol. 22:101-108(1987).

-1- EUNCTION: THE CIRCUMSPOROZOITE PROTEIN IS THE IMMUNODOMINANT
SURFACE ANTIGEN ON THE SPOROZOITE (THE INFECTIVE STAGE OF THE
MALARIA PARASITE THAT IS TRANSMITTED FROM THE MOSQUITO TO THE
VERTEBRATE HOST).

-1- MISCELLANEOUS: THE C-TERMINAL REGION IS PROBABLY USED FOR
ANCHORING THE PROTEIN TO THE CELL MEMBRANE. THE REPEAT SEQUENCES
WOULD BE THE SUBFACE ANTIGEN OF THE ORGANISM.

-1- SIMILARITY: CONTAINS 1 TSP TYPE-1 DOMAIN.
